# AM/PM Time Display Format

Sapling offers a variety of digital clock models, all of which can display the time in either the 12-hour or 24-hour display format as standard.

For the 12-hour format, the digital clock will show the time with a dot in the upper left corner of the display to indicate that the time is now in PM while there will be no dot in the corner when the time is in AM.

The second option is to display time in the 24-hour format. In this case, for example, the clock will display 22:00 instead of 10:00. The 24-hour format will not have the dot in the corner to indicate the time is in PM. The dot on the digital display will appear only when the clock is showing PM time in the 12-hour format.

As standard, all Sapling digital clocks come programmed in the 12-hour display format. This feature is field selectable and can easily be changed to the 24-hour format. For instructions on how to change this, please refer to the manual for your clock model.

Sapling digital clocks offer two formatting options to display the time with all of our digital clock models: 12-hour and 24-hour. For your convenience, each display format indicates whether the time is AM/PM on the clock as a standard feature and can be changed easily by the customer to the 24-hour format if preferred.
